

What have we learned?

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing
- Plants also create another carbohydrate, cellulose, to build up its body

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing
- Plants also create another carbohydrate, cellulose, to build up its body
- The presence of producers in an ecosystem will support primary consumers

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing
- Plants also create another carbohydrate, cellulose, to build up its body
- The presence of producers in an ecosystem will support primary consumers
- Photosynthesis and cellular respiration act as a cycle in an ecosystem

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing
- Plants also create another carbohydrate, cellulose, to build up its body
- The presence of producers in an ecosystem will support primary consumers
- Photosynthesis and cellular respiration act as a cycle in an ecosystem
- Through these chemical reactions, energy and matter are both cycled through an ecosystem

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing
- Plants also create another carbohydrate, cellulose, to build up its body
- The presence of producers in an ecosystem will support primary consumers
- Photosynthesis and cellular respiration act as a cycle in an ecosystem
- Through these chemical reactions, energy and matter are both cycled through an ecosystem
- Energy can be converted to matter, and matter can be converted to energy

- Photosynthesis:  $6\text{CO}_2 + 6\text{H}_2\text{O} + \text{sunlight} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$
- Producers use photosynthesis to make glucose (and oxygen)
- Cellular Respiration:  $\text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2 \rightarrow 6\text{CO}_2 + 6\text{H}_2\text{O} + \text{ATP}$
- All organisms use cellular respiration to make ATP (and carbon dioxide & water)
- Chemical reactions allow cells to break up molecules and bond the elements back together to form different molecules
- Carbon is the most important element to living things
- Plants gain carbon from the atmosphere, water through their roots
- Seeds contain stores of glucose (carbohydrates) to make ATP for use in growing
- Plants also create another carbohydrate, cellulose, to build up its body
- The presence of producers in an ecosystem will support primary consumers
- Photosynthesis and cellular respiration act as a cycle in an ecosystem
- Through these chemical reactions, energy and matter are both cycled through an ecosystem
- Energy can be converted to matter, and matter can be converted to energy
- Producers, consumers, and decomposers all play a role in a healthy, balanced ecosystem
